POS SOFTWARE

Installation & Setup Manual

Version 2.0.0

A step-by-step guide to installing LOOPER on Windows

Before You Begin

This guide explains how to install LOOPER POS Software (Setup version 2.0.0) on a Windows computer using the installer screens provided.

Important security note

Windows may display a Microsoft Defender SmartScreen warning because the installer is not recognized or does not have a verified publisher signature. Continue only if you obtained the LOOPER installer from a trusted, official source and you are confident that the file has not been modified. If you are unsure about the file, choose “Don’t run” and contact the software provider.

Recommended installation choice

For a normal installation on your own Windows account, choose “Install for me only (recommended)”. This avoids requiring administrator privileges. Choose “Install for all users” only if the software should be available to every Windows account on the computer and you have administrator permission.

Installation steps

Step 1 — Open More info on the SmartScreen warning

When you open the LOOPER installer, Windows may show “Windows protected your PC”.

Check that the app name is the expected LOOPER setup file. Select “More info” to display the app and publisher details.

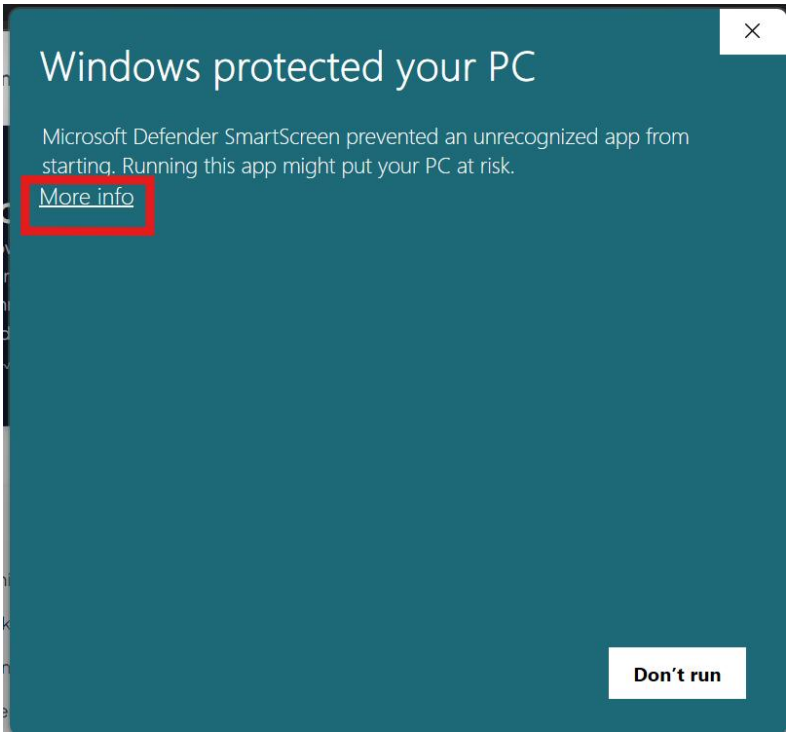

Figure 1. Open More info on the SmartScreen warning

Step 2 — Confirm the installer and choose Run anyway

After selecting "More info", Windows displays additional details. In this example, the app is "LOOPER-Setup (1).exe" and the publisher is shown as "Unknown publisher".

If—and only if—you trust the source of this installer and have verified that it is the correct LOOPER setup file, select "Run anyway". Otherwise, select "Don't run".

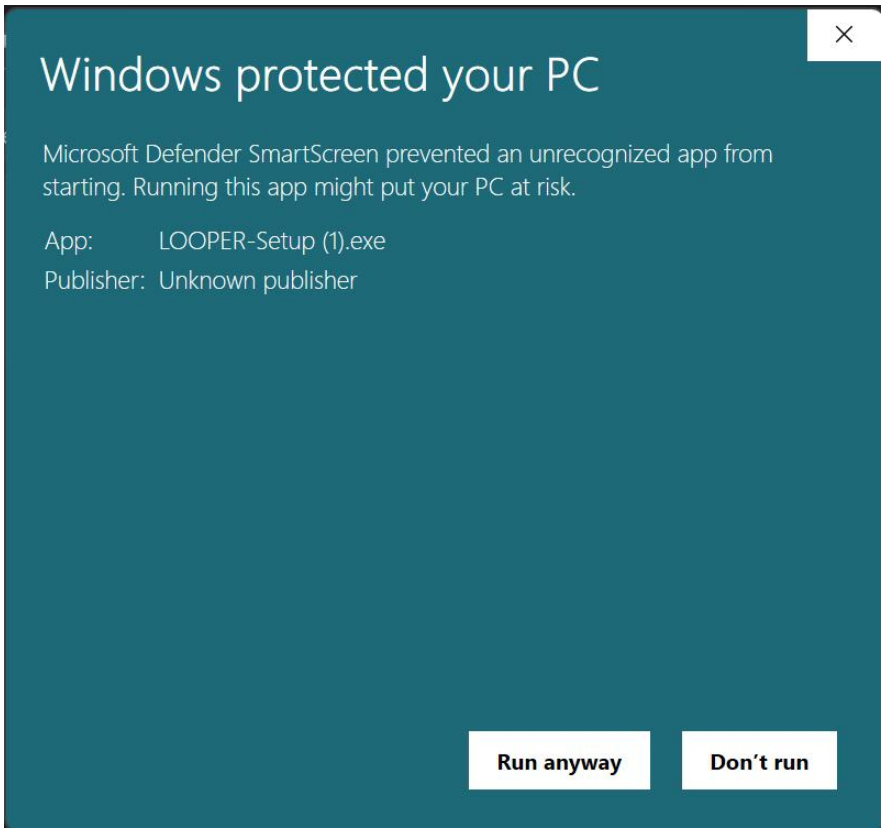

Figure 2. Confirm the installer and choose Run anyway

Step 3 — Select the installation mode

The setup wizard asks whether LOOPER should be installed for the current Windows account or for all users.

Choose "Install for me only (recommended)" for a standard installation. The "Install for all users" option requires administrative privileges.

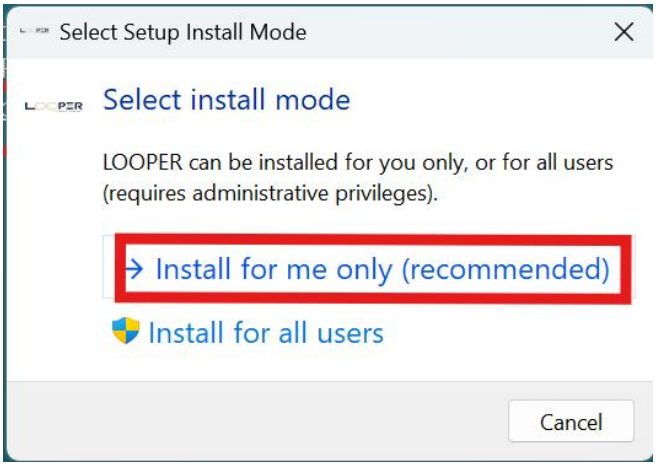

Figure 3. Select the installation mode

Step 4 — Choose the destination folder

The installer displays the folder where LOOPER will be installed. The default location shown is:

```
C:\Users\QS\AppData\Local\Programs\LOOPER
```

You can keep the default location, which is recommended for most users, or select “Browse” to choose another folder. Select “Next” to continue.

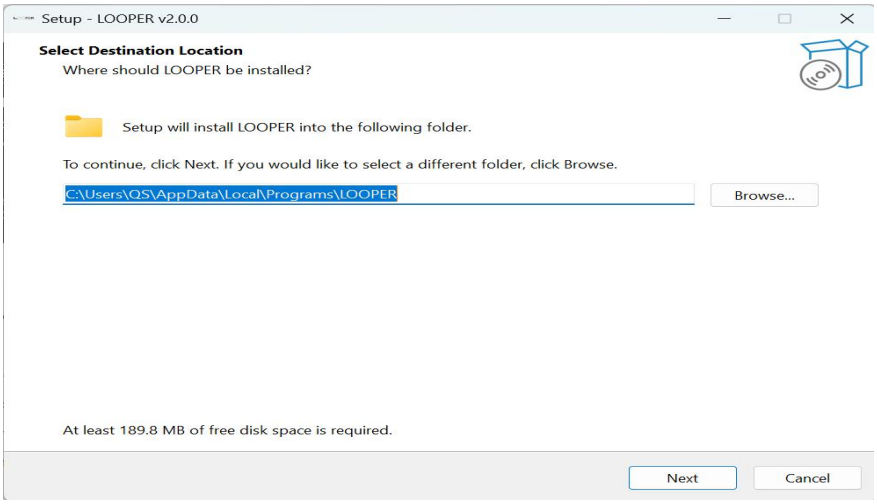

Figure 4. Choose the destination folder

Step 5 — Choose the Start Menu folder

The setup wizard asks where to place the program’s Start Menu shortcuts.

Keep the default folder name “LOOPER” unless you have a specific reason to change it. Select “Next” to continue.

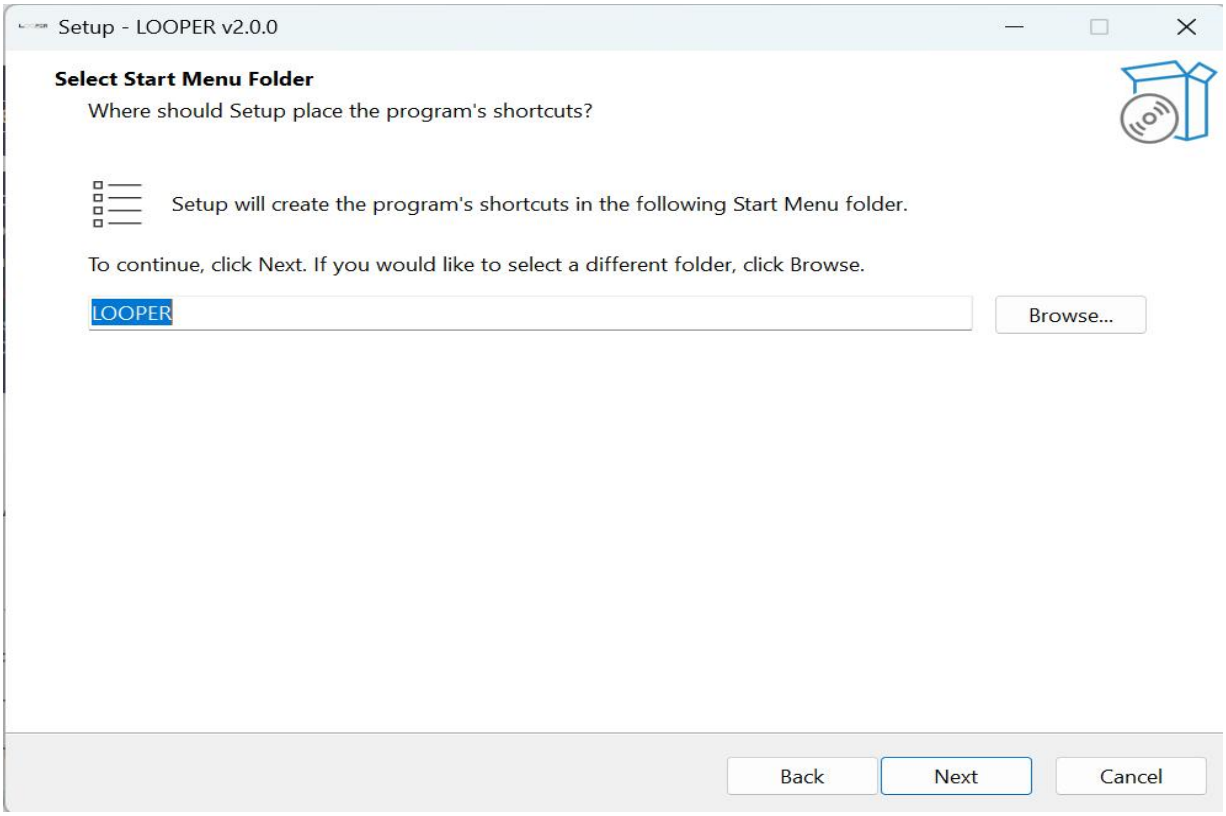

Figure 5. Choose the Start Menu folder

Step 6 — Review the settings and install

The "Ready to Install" screen summarizes the destination folder, Start Menu folder, and additional tasks.

Review the information. If everything is correct, select "Install" to begin installing LOOPER. If you need to change anything, select "Back".

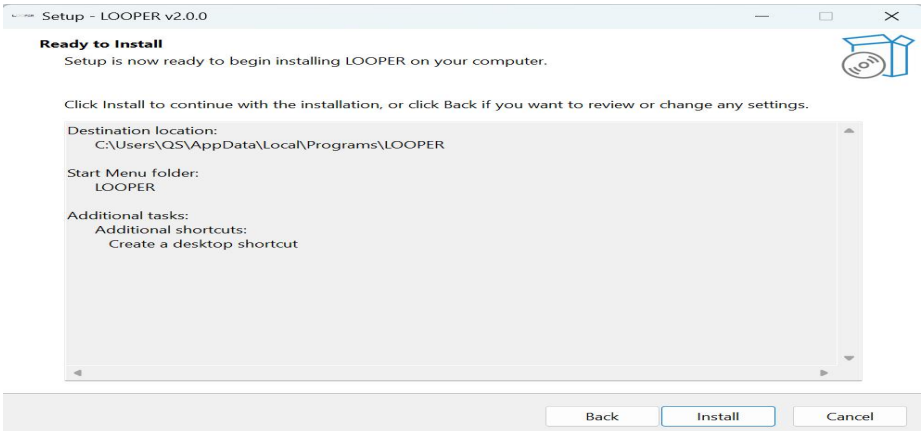

Figure 6. Review the settings and install

After Selecting Install

Allow the setup wizard to complete. The screenshots supplied for this manual end at the "Ready to Install" screen, so the final progress and completion screens are not shown here. Follow any remaining prompts displayed by the installer. When setup reports that installation is complete, use the available Finish or Close option, if shown, and then launch LOOPER from the desktop shortcut or Start Menu.

Login Screen

Enter Password: admin123 and Username: admin or just click on demo hint button

If You Need Help

If Windows blocks the installer, the installation fails, or you are unsure whether the setup file is genuine, stop the installation and contact your LOOPER software provider. Do not disable Microsoft Defender or other Windows security protections just to run the installer.
